

MILITARY SECURITY LEVEL MOBILE PHONE

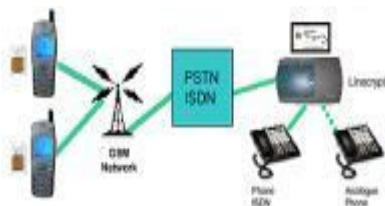

GSM is quite unsafe mobile telecommunications system in modern world. It has many weaknesses that make it unsuitable for exchanging confidential or sensitive information by government officials, bureaucrats, law enforcement agencies and corporate bodies. Communication can be monitored or intercepted by readily available surveillance equipment. End-to-end security is not provided, nor is it possible to authenticate the individual with which you are in contact.

This specialized Mobile Phone is a totally secure, fully upgradeable mobile phone that uses military-level encryption to enable unbreachable communication with other specialized phone users via all standard GSM networks.

Technology used in this phone is based around two internal SMART cards. The first card delivers standard GSM services. The second, issued by a GRTC delivers powerful encryption using EOP.

Pioneering design merges these two technologies to create an unique, unbreakable 'cyphering key' for each and every call – providing failsafe point-to-point authentication and unbreakable privacy within a closed user group. The secure mobiles can be used as 'stand alone' units.

Alternatively they can be incorporated into a PSTN/ISDN system as shown below.

Simple one button operation makes this ideal for worldwide, totally confidential, high level communications between Clients, Lawyers, Stockbrokers, Accountants etc.,

PLEASE NOTE:

Due to the high level of encryption this equipment requires an end user license for sale outside of the EU. Buyer must produce authorization letter to buy.
